Signatures of neutron star oscillations in post-glitch emission of radiopulsars

A.N. Timokhin

Sternberg Astronomical Institute, Moscow, Russia
Experimental study of NS structure

- Internal structure of celestial objects → need some kind of seismology

- In order to be able to proceed with seismological diagnostic two things are necessary:
  - Mechanism for oscillation excitation
  - Mechanism modulating radiation of the object
Observation of NS oscillations

- Neutron stars in binary systems:
  - Mechanism for oscillation excitation: instabilities in accretion flows.
  - Mechanism modulating radiation of the object: shaking of magnetic field lines, instabilities in boundary layer ... 

**but**, could we distinguish effects caused by oscillation of the *neutron star* and ones due to instabilities in the accretion flow? – which feature in the power spectrum corresponds to the *NS* oscillation and which to other processes?

- Isolated neutron stars – most of them radiopulsars:
  - Mechanism for oscillation excitation: **glitch**
  - Mechanism modulating radiation of the object: **this work**
Goldreich-Julian charge density and structure of the magnetosphere
Summary

- We consider NS as a conducting magnetized sphere on which surface an arbitrary velocity (vector) field is given. This field can be considered as a composition of series of Spheroidal and Toroidal modes with harmonic numbers \((l, m)\).

- We looked for special configuration of electric field, such that, \(\mathbf{E} \perp \mathbf{B}\) everywhere in the magnetosphere, so-called Goldreich-Julian field. Charge density in the magnetosphere, supporting such electric field \(\rho_{\text{GJ}} \equiv \Delta \cdot \mathbf{E}/(4\pi)\) is called Goldreich-Julian charge density.

- We derived equation for such field for any oscillation mode \((l, m)\) and analysed solutions of this equation.

- So, to some extent we generalized the pulsar “standard model” to the case of arbitrary oscillations. This allows us to study distortion of NS magnetosphere caused by star oscillations and estimate electromagnetic energy losses of an oscillating NS.
Assumptions

- We consider the near zone $r \ll 2\pi \frac{c}{\omega}$ where

  \[
  \frac{1}{c} \partial_t E \ll \nabla \times B
  \]

- We assume that the physical current density in the magnetosphere is low enough – the magnetic field to first order in $\tilde{\xi} \equiv \xi/r_*$ can be considered as generated only by volume currents inside the NS and by surface currents on its surface, i.e.

  \[
  \frac{4\pi}{c} j \ll \nabla \times B^{(1)} \sim \frac{l}{r} \left( B^{(0)} \frac{\xi}{r_*} \right)
  \]

- The latter implies

  \[
  j \ll \frac{B \xi \omega l}{4\pi cr_*} \frac{c}{r\omega} \sim \rho_{GJ}(r_*) \frac{c}{\omega r} \left( \frac{c}{\omega r} \right)
  \]
Basic Equations

- Maxwell Equations

\[ \nabla \cdot \mathbf{E} = 4\pi \rho \quad (1) \]
\[ \nabla \times \mathbf{E} = -\frac{1}{c} \partial_t \mathbf{B} \quad (2) \]
\[ \nabla \cdot \mathbf{B} = 0 \quad (3) \]
\[ \nabla \times \mathbf{B} = 0 \quad (4) \]

- Boundary Conditions

\[ B_r(r_*) = B_0 r \]
\[ E_{\theta, \phi}(r_*) = -\frac{1}{c} (\mathbf{v} \times \mathbf{B}_0)_{\theta, \phi} \]
General Solution of the Maxwell equations
From (3), (4) it follows [Muslimov & Tsygan 1986]:

\[ \mathbf{B} = \nabla \times \nabla \times (P \mathbf{e}_r) \]

Substituting \( \mathbf{B} \) into equation (2) we get

\[ \mathbf{E} = -\frac{1}{c} \nabla \times (\partial_t P \mathbf{e}_r) - \nabla \Psi \]  

Equation for the electric field
We are looking for a charge density \( \rho_{GJ} \) yielding \( \mathbf{E} \perp \mathbf{B} \)

\[ \mathbf{E}_{GJ} \cdot \mathbf{B} = 0 \]  

(6)

\[ \rho_{GJ} = \frac{1}{4\pi} \nabla \cdot \mathbf{E}_{GJ} = -\frac{1}{4\pi} \Delta \Psi_{GJ} \]  

(7)

substituting \( \mathbf{E} \) from the expression for the general solution of Maxwell Equations (5) into equation (6) we get
Equation for the Goldreich-Julian potential $\Psi_{GJ}$

$$\Delta_{\Omega} P \partial_r \Psi_{GJ} - \partial_r \partial_\theta P \partial_\theta \Psi_{GJ} - \frac{1}{\sin^2 \theta} \partial_r \partial_\phi P \partial_\phi \Psi_{GJ} + \frac{1}{c \sin \theta} \{\partial_r \partial_\phi P \partial_\theta \partial_t P - \partial_r \partial_\theta P \partial_\phi \partial_t P\} = 0$$

(8)

+ boundary conditions
Equation for the Goldreich-Julian potential $\Psi_{GJ}$

\[
\begin{align*}
\Delta_\Omega P & \quad \partial_r \Psi_{GJ} \quad - \quad \partial_r \partial_\theta P \quad \partial_\theta \Psi_{GJ} \quad - \quad \frac{1}{\sin^2 \theta} \quad \partial_r \partial_\phi P \quad \partial_\phi \Psi_{GJ} + \\
& \quad \frac{1}{c \sin \theta} \left\{ \partial_r \partial_\phi P \quad \partial_\theta \partial_t P - \quad \partial_r \partial_\theta P \quad \partial_\phi \partial_t P \right\} = 0
\end{align*}
\] (8)

+ boundary conditions

- The terms in gray boxes are coefficients depending on the unperturbed magnetic field configuration, they do not depend on the concrete oscillation mode.
Equation for the Goldreich-Julian potential $\Psi_{\text{GJ}}$

$$\Delta_{\Omega} P \frac{\partial_r \Psi_{\text{GJ}}}{\partial r} - \frac{1}{\sin^2 \theta} \frac{\partial_r \partial_\phi P}{\partial r} \frac{\partial_\phi \Psi_{\text{GJ}}}{\partial \phi} +$$

$$+ \frac{1}{c \sin \theta} \left\{ \frac{\partial_r \partial_\phi P}{\partial r} \frac{\partial_\theta \partial_t P}{\partial \theta} - \frac{\partial_r \partial_\theta P}{\partial r} \frac{\partial_\phi \partial_t P}{\partial \phi} \right\} = 0 \quad (8)$$

**boundary conditions**

- The terms in gray boxes are coefficients depending on the unperturbed magnetic field configuration, they do not depend on the concrete oscillation mode.
- Terms with $\partial_t P$ describe perturbations of the magnetic field by the stellar oscillations and are different for each oscillation mode $(l, m)$. 
Equation for the Goldreich-Julian potential $\Psi_{GJ}$

$$\Delta_\Omega P \left( \partial_r \Psi_{GJ} - \frac{\partial_r}{\partial \theta} P \partial_\theta \Psi_{GJ} - \frac{1}{\sin^2 \theta} \partial_r \partial_\phi P \partial_\phi \Psi_{GJ} + \frac{1}{c \sin \theta} \left\{ \partial_r \partial_\phi P \partial_\theta \partial_t P - \partial_r \partial_\theta P \partial_\phi \partial_t P \right\} \right) = 0 \quad (8)$$

**boundary conditions**

- The terms in gray boxes are coefficients depending on the unperturbed magnetic field configuration, they do not depend on the concrete oscillation mode.
- Terms with $\partial_t P$ describe perturbations of the magnetic field by the stellar oscillations and are different for each oscillation mode $(l, m)$.

This equation is linear PDE of the first order. Hence, oscillation modes can be considered separately.
Rotation around $z$ axis – Pulsar

- In this case the partial derivative $\partial_t$ can be replaced by $-\Omega \partial_\phi$, where $\Omega$ is the angular velocity. Thus

$$\partial_t P = -\Omega \partial_\phi P$$

By direct substitution of

$$\Psi_{\text{GJ}} = -\frac{\Omega}{c} \sin \theta \partial_\theta P$$

it can be shown that the potential (9) is a solution of the equation (8) from the previous slide, and satisfies the boundary conditions for $\Psi_{\text{GJ}}$.

- For electric field and charge density we get

$$E_{\text{GJ}} = -\frac{1}{c} (\Omega \times r) \times B$$

$$\rho_{\text{GJ}} = -\frac{\Omega \cdot B}{2\pi c} + \frac{1}{4\pi c} (\Omega \times r) \cdot (\nabla \times B)$$
Considered Cases

- Small amplitude oscillations of the NS with dipole magnetic field.
- Both toroidal \((\nabla \cdot \mathbf{V}_{\text{osc}} = 0)\) and spheroidal \((\nabla \times \mathbf{V}_{\text{osc}} = 0)\) oscillation modes were considered.
- Equation for \(\Psi_{GJ}\) can be solved analytically for both toroidal and spheroidal modes. Hence, Goldreich-Julian charge density can be calculated for any velocity field on the NS surface.

**Examples**

Spheroidal modes:
- \(\Psi_{GJ}\): (7,3); (7,2);
- \(\rho_{GJ}\): (7,3); (7,2);

Toroidal modes:
- \(\Psi_{GJ}\): (1,0); (2,0); (2,1);
- \(\rho_{GJ}\): (1,0); (2,0); (2,1);
Distortion of the polar cap acceleration zone
Spheroidal Mode (44,4) and PSR J1824-2452

Figure 1: *left*: Goldreich-Julian Charge Density for oscillation mode (44,4) in polar coordinates ($|\rho_{\text{GJ}}^{lm}|_{r=r_*}$, $\theta$) for $\phi = 0$. The red line shows the angle at which the last closed field line intersects the NS surface in PSR J1824-2452 (P=3.05 ms) *right*: The view of the PSR J1824-2452 polar cap (dashed circle). Goldreich-Julian Charge density for oscillation mode (44,4) is shown by the color map (red-positive, blue-negative)
GJ charge density: dependence on $l$

(24,4)  
(44,4)  
(64,4)
GJ charge density: dependence on $m$

(64,4)  

(64,8)  

(64,14)
The amplitude of $\rho_{GJ}$ increases with increasing of the harmonic numbers $l, m$.

The reason:
- the electric field
  $$E \sim \frac{V_{osc}}{c} B$$
- the charge density
  $$\rho \sim \frac{E}{\delta x} \approx \frac{l E}{R}$$

The amplitude of $\rho_{GJ}$ for high harmonic numbers falls very rapidly with the distance from the NS.
\[ \rho = \rho_{GJ}^{(0)} \left( \frac{S_0}{S_2} \right) \neq \rho_{GJ}^{(2)} \text{, } \mathbf{E} \cdot \mathbf{B} \neq 0 \]

- If \( |\rho_{GJ}^{(2)}| > |\rho| \) accelerating electric field is built
- If \( |\rho_{GJ}^{(2)}| < |\rho| \) there will be no particle acceleration at all
Figure 2: Difference between the charge density of space charge limited flow and the local Goldreich-Julian charge density along magnetic field lines in the polar cap region is shown (in arbitrary units) for three spheroidal modes with different \((l, m)\): \((64,14)\) – by the upper solid line, \((54,14)\) – by the middle solid line, \((54,2)\) – by the lower solid line. The same relation for an aligned rotator is shown by the dashed line.
Velocity of oscillational motion

- Energy transferred during the glitch

\[ W_{\text{glitch}} = I \Omega \Delta \Omega = I \Omega^2 \frac{\Delta \nu}{\nu} = \frac{i}{2} I_{\text{NS}} \left( \frac{2\pi}{P} \right)^2 \frac{\Delta \nu}{\nu} \]

- some fraction $\eta$ of this energy goes to oscillation excitation

\[ W_{\text{osc}} = \eta W_{\text{glitch}} \]

- Energy of oscillational motion

\[ E_{\text{osc}} \approx \frac{M_{\text{osc}} V_{\text{osc}}^2}{2} = \epsilon M_{\text{NS}} V_{\text{osc}}^2 \]

- oscillational velocity

\[ V_{\text{osc}} \approx 500 \, \eta^{\frac{1}{2}} \, \epsilon^{-\frac{1}{2}} \, i^{\frac{1}{2}} \, P^{-1} \left( \frac{\Delta \nu}{\nu} \right)^{\frac{1}{2}} \, \text{cm sec}^{-1} \]
Effective Goldreich-Julian charge density

- Electric field induced by oscillations
  \[ E \sim \frac{V_{osc}}{c} B \]

- Goldreich-Julian charge density for oscillational mode \((l, m) \sim 1\)
  \[ \rho_{GJ}^{osc} \sim \frac{E}{\Delta x} \sim \frac{1}{r_*} \frac{E}{r_*} = \frac{V_{osc}}{c} \frac{B}{r_*} \]

- Effective Goldreich-Julian charge density
  - oscillational
    \[ \rho_{GJ}^{osc, eff} \sim \rho_{GJ}^{osc} \]
  - rotational – Muslimov & Tsygan model (particles freely escape NS surface)
    \[ \rho_{GJ}^{rot, eff} \sim \kappa \rho_{GJ}^{rot} \sim 0.15 \rho_{GJ}^{rot} \]
  - rotational – Ruderman & Sutherland model (particles do not escape NS surface)
    \[ \rho_{GJ}^{rot, eff} \sim \rho_{GJ}^{rot} \]
Distortion of the accelerating electric field

Distortion of the accelerating electric field in the polar cap is proportional to

\[ \frac{\rho_{GJ}^{osc,eff}}{\rho_{GJ}^{rot,eff}} \]

- for Muslimov & Tsygan model

\[ \frac{\rho_{GJ}^{osc,eff}}{\rho_{GJ}^{rot,eff}} \approx 3.5 \times 10^{-3} \frac{1}{1} \eta_\%^{1/2} \epsilon^{-1/2} \iota^{1/2} \left( \frac{\Delta\nu}{\nu} \right)^{1/6} \]

- Ruderman & Sutherland model

\[ \frac{\rho_{GJ}^{osc,eff}}{\rho_{GJ}^{rot,eff}} \approx 5.3 \times 10^{-4} \frac{1}{1} \eta_\%^{1/2} \epsilon^{-1/2} \iota^{1/2} \left( \frac{\Delta\nu}{\nu} \right)^{1/6} \]
Harmonics where acceleration is damped

When \( \frac{\rho_{\text{osc, eff}}}{\rho_{\text{rot, eff}}} \sim 1 \) acceleration of particles in the polar cap will be blocked periodically. This occurs

- for Muslimov & Tsygan model, when

\[
1 > 300 \, \eta_{\%}^{-1/2} \, \epsilon^{1/2} \, i^{-1/2} \left( \frac{\Delta \nu}{\nu} \right)^{-1/2}
\]

- Ruderman & Sutherland model, when

\[
1 > 2000 \, \eta_{\%}^{-1/2} \, \epsilon^{1/2} \, i^{-1/2} \left( \frac{\Delta \nu}{\nu} \right)^{-1/2}
\]
Possible observational signatures

Figure 3: Schematic view of individual pulse distortion in pulsar due to oscillation of the neutron star.
Conclusions

- For the half of oscillation modes a strong current ($\gg \rho_{GJ} c$) will flow along closed magnetic field lines.
- In the polar cap region particle acceleration rate could be modulated with oscillation period. For oscillation modes with $l$, $m$ large enough “decelerating” electric field could be of compatible strength with the accelerating field due to pulsar rotation even if $V_{osc} << V_{rot} = \Omega r_*$.
- Region of closed field lines could become visible.
- Oscillations can distort acceleration of particles in the polar cap region of the pulsar and change its radiation pattern.
- Distortion of the geometry of radiation region due to shaking of magnetic field lines is also possible, but is much more difficult to observe.
Boundary Conditions

**Magnetic field**

\[ \mathbf{B} = \nabla \times \nabla \times \mathbf{P}_{\mathbf{e}_r}, \quad \text{to the first order in } \frac{\xi}{r} : \mathbf{P} \approx \mathbf{P}_0 (r, \theta, \phi) + \delta \mathbf{P} (t, r, \theta, \phi) \]

\[
\partial_t \delta \mathbf{P} = \sum_{l, m} \left( \frac{r}{r_*} \right)^l \partial_t \delta \mathbf{p}_{lm} (t) \mathbf{Y}_{lm} (\theta, \phi)
\]

\[
\partial_t \delta \mathbf{p}_{lm} (t) = \frac{1}{l(l+1)} \int_{4\pi} \mathbf{Y}_{lm}^* \mathbf{v} \cdot \nabla (\Delta \mathbf{P}_0) + \left. \Delta \mathbf{P}_0 (\nabla \cdot \mathbf{v}_\perp) + r^2 (\nabla_\perp (\partial_r \mathbf{P}_0) \cdot \nabla_\perp) \mathbf{v}_r \right|_{r=r_*}
\]

**Boundary Conditions for** \( \Psi_{\text{GJ}} \)

\[
\Psi_{\text{GJ}} \big|_{r=r_*} = -\frac{1}{c} \int \left\{ \frac{1}{r} \Delta \mathbf{P}_0 \mathbf{v}_\phi + \frac{1}{\sin \theta} \partial_r \partial_\theta \mathbf{P}_0 \mathbf{v}_r + \frac{1}{\sin \theta} \partial_\phi \partial_\theta \delta \mathbf{P} \right\} \mathbf{d} \theta \bigg|_{r=r_*} + e^{-i\omega t} F(\phi)
\]

\[
\Psi_{\text{GJ}} \big|_{\theta=0; r=r_*} = 0
\]
Oscillation modes

- The oscillation velocity components for spheroidal ($\nabla \times \mathbf{v} = 0$) oscillations are
  \[
  v_r = e^{-i\omega t} U(r) Y_{lm}(\theta, \phi), \quad v_\theta = e^{-i\omega t} V(r) \frac{1}{\sin \theta} \partial_\phi Y_{lm}(\theta, \phi), \\
  v_\phi = e^{-i\omega t} V(r) \frac{1}{\sin \theta} \partial_\phi Y_{lm}(\theta, \phi)
  \]
  where $U$ and $V$ are radial and transversal velocity amplitude respectively.

- The oscillation velocity components for toroidal ($\nabla \cdot \mathbf{v} = 0$) oscillations are
  \[
  v_r = 0, \quad v_\theta = e^{-i\omega t} W(r) \frac{1}{\sin \theta} \partial_\phi Y_{lm}(\theta, \phi), \quad v_\phi = -e^{-i\omega t} W(r) \partial_\theta Y_{lm}(\theta, \phi)
  \]
  where $W$ is transversal velocity amplitude.
Equation for $\psi_{GJ}$

$$2 \cos \theta \, \partial_r \psi_{GJ}^l + \frac{1}{r} \sin \theta \, \partial_\theta \psi_{GJ}^l - \frac{m^2}{l(l+1)} \frac{B_0w}{c} \left( \frac{r^*}{r} \right)^{l+1} Y_{lm} = 0$$

Boundary conditions

$$\psi_{GJ}^l \left|_{r=r^*} \right. = - \frac{B_0w r^*}{c} \int \left( \cos \theta \, \partial_\theta Y_{lm} - \frac{m^2}{l(l+1)} \frac{Y_{lm}}{\sin \theta} \right) d\theta + e^{-i\omega t} F(\phi) ,$$

$$\psi_{GJ}^l \left|_{\theta=0, r=r^*} \right. = 0 .$$

Solution

$$\psi_{GJ}^l = \frac{m^2}{l(l+1)} \frac{B_0w r^*}{c} \left( \frac{r^*}{r} \right)^l \sin^2 \theta \int \frac{Y_{lm}}{(\sin \theta)^{2l+1}} d\theta + \Phi_{lm} \left( \sin \theta \left( \frac{r^*}{r} \right)^{1/2} , \phi , t \right)$$
Spheroidal oscillations

- **Equation for** $\Psi_{GJ}$

\[
2 \cos \theta \partial_r \Psi_{GJ}^{lm} + \frac{1}{r} \sin \theta \partial_\theta \Psi_{GJ}^{lm} - \frac{B_0}{c} \left[ Z_1 \left( \frac{r_\ast}{r} \right)^l \partial_\phi Y_{l-1}^m + Z_2 \left( \frac{r_\ast}{r} \right)^{l+2} \partial_\phi Y_{l+1}^m \right] = 0 ,
\]

where
\[
Z_1 = \frac{1}{l} \left( (l+1)V - U/2 \right) \sqrt{\frac{l^2 - m^2}{4l^2 - 1}} \quad \text{Z}_2 = \frac{1}{l+1} \left( lV + U/2 \right) \sqrt{\frac{(l+1)^2 - m^2}{(2l+3)(2l+1)}}
\]

- **Boundary conditions**

\[
\Psi_{GJ}^{lm} \bigg|_{r=r_\ast} = - \frac{B_0 r_\ast}{c} \int \left( V \cot \theta \partial_\phi Y_{lm} - Z_1 \frac{\partial_\phi Y_{l-1}^m}{\sin \theta} - Z_2 \frac{\partial_\phi Y_{l+1}^m}{\sin \theta} \right) d\theta + e^{-i\omega t} F(\phi) ,
\]

\[
\Psi_{GJ}^{lm} \bigg|_{\theta=0, r=r_\ast} = 0
\]

- **Solution**

\[
\Psi_{GJ}^{lm} = - \frac{B_0 r_\ast}{c} \left\{ Z_1 \left( \frac{r_\ast}{r} \right)^{l-1} (\sin \theta)^{2l-2} \int \frac{\partial_\phi Y_{l-1}^m}{(\sin \theta)^{2l-1}} d\theta + Z_2 \left( \frac{r_\ast}{r} \right)^{l+1} (\sin \theta)^{2l+2} \int \frac{\partial_\phi Y_{l+1}^m}{(\sin \theta)^{2l+3}} d\theta \right\} + \Phi_{lm} \left( \sin \theta \left( \frac{r_\ast}{r} \right)^{1/2} , \phi , t \right)
\]
Figure 4: *left*: Deformation of the star surface during oscillation in spheroidal mode \((7, 3)\) *right*: The potential \(\Psi_{73}^{GJ}\) along a dipolar magnetic field line as a function of the polar angle \(\theta\) is shown for 5 field lines with azimuthal angle \(\phi = 0\) at \(t = 2\pi n/\omega\).

Strong current in the magnetosphere

- For toroidal modes with even \((l - m)\), and spheroidal modes with odd \((l - m)\) the strong current with the current density

\[
\rho_{GJ}(r_*) \, c \left( \frac{c}{\omega r} \right)
\]

should flow along closed magnetic field lines.

- For the open magnetic field lines we could use our solution
Strong current in the magnetosphere

- For toroidal modes with even \((l - m)\), and spheroidal modes with odd \((l - m)\) the strong current with the current density

\[
\rho_{GJ}(r_*) c \left( \frac{c}{\omega r} \right)
\]

should flow along closed magnetic field lines.
- For the open magnetic field lines we could use our solution

Observational manifestations
- This current could generate plasma instabilities and make closed field line regions visible.
- Oscillation modes generating strong current will be more effectively damped.
Glitching Pulsars

Pulsar $P - \dot{P}$ dot diagram. Pulsars for which one or more glitches have been detected are marked.
