

## Learning Goals

- Decide when the work done by a gas is positive or negative
- Calculate work done by a gas in a process given how the pressure changes with volume during a process
- Relate the work done by a gas to the area under the curve describing the process on a PV diagram
- Explain why the work done by a gas plus the work done by the environment of the gas (external forces) should add to zero
- Explain what is meant by the internal energy of a gas
- Calculate the change in internal energy for a gas given the change in temperature

# THE FIRST LAW OF THERMODYNAMICS = Conservation of energy

also called  $\Delta U$

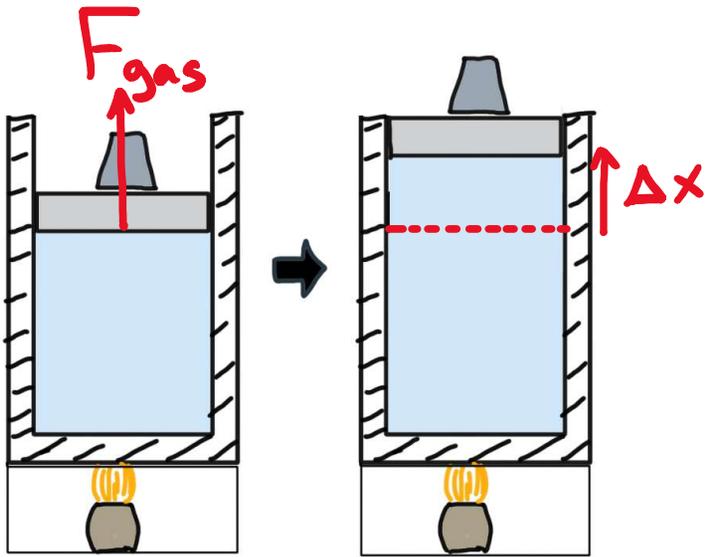

$$\Delta E_{\text{gas}} = Q - W$$

↑ net change in energy of gas

↑ heat added to gas

↑ work done by gas

WORK : transfer of energy via mechanical process

work done by system

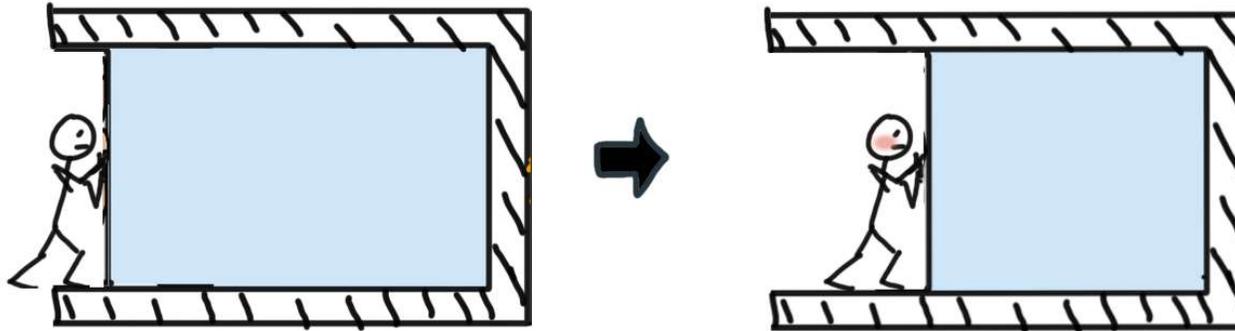

$$W = F \cdot \Delta x_{||}$$

Force  
exerted  
by  
system

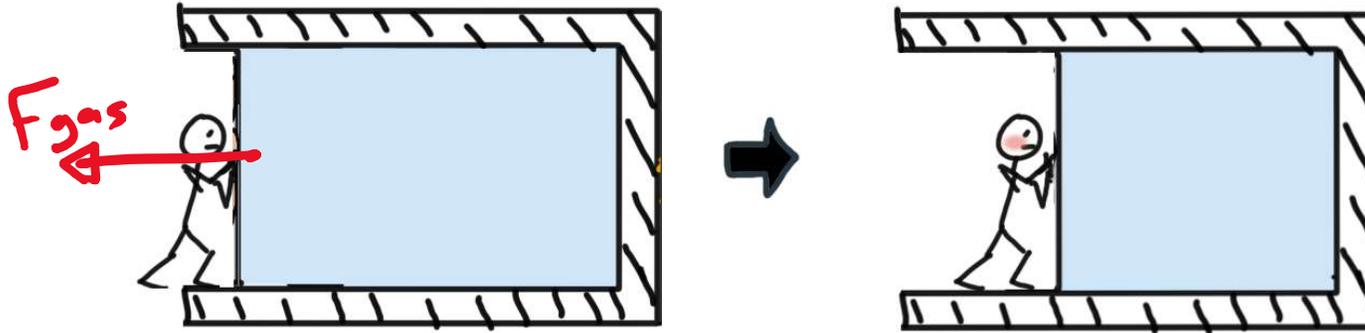

displacement  
in direction  
of force

- assumes constant force

A gas with pressure  $P$  is in a cylinder with a piston of area  $A$ . A little man pushes the piston and moves it by a small amount  $d$ . If the pressure remains approximately constant during this time, the work  $W$  done by the gas in this process is:

- A)  $W = 0$  : the little man is doing the work.
- B)  $W$  is positive and equal to  $P A d$
- C)  $W$  is negative and equal to  $- P A d$
- D) Not enough information to answer.

- C)  $W$  is negative and equal to  $- P A d$
- D) Not enough information to answer.

$$F_{gas} = P \cdot A$$

displacement in direction of force is

$$\Delta x_{||} = -d$$

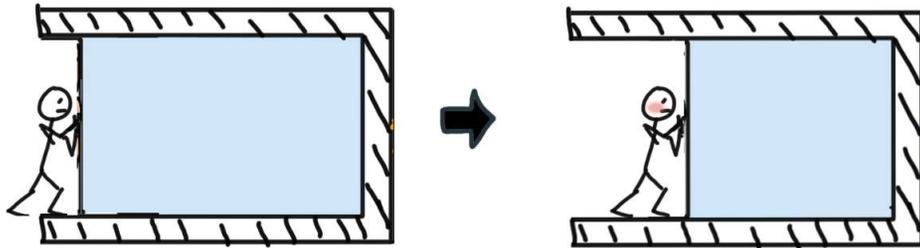

$$W = F_{gas} \cdot \Delta x_{||} = -P \cdot A \cdot d$$

$$= P \Delta V$$

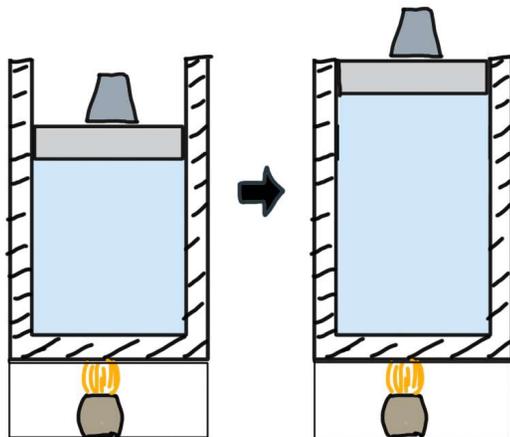

Work done by a gas (constant pressure):

$$W_{\text{gas}} = P \Delta V$$

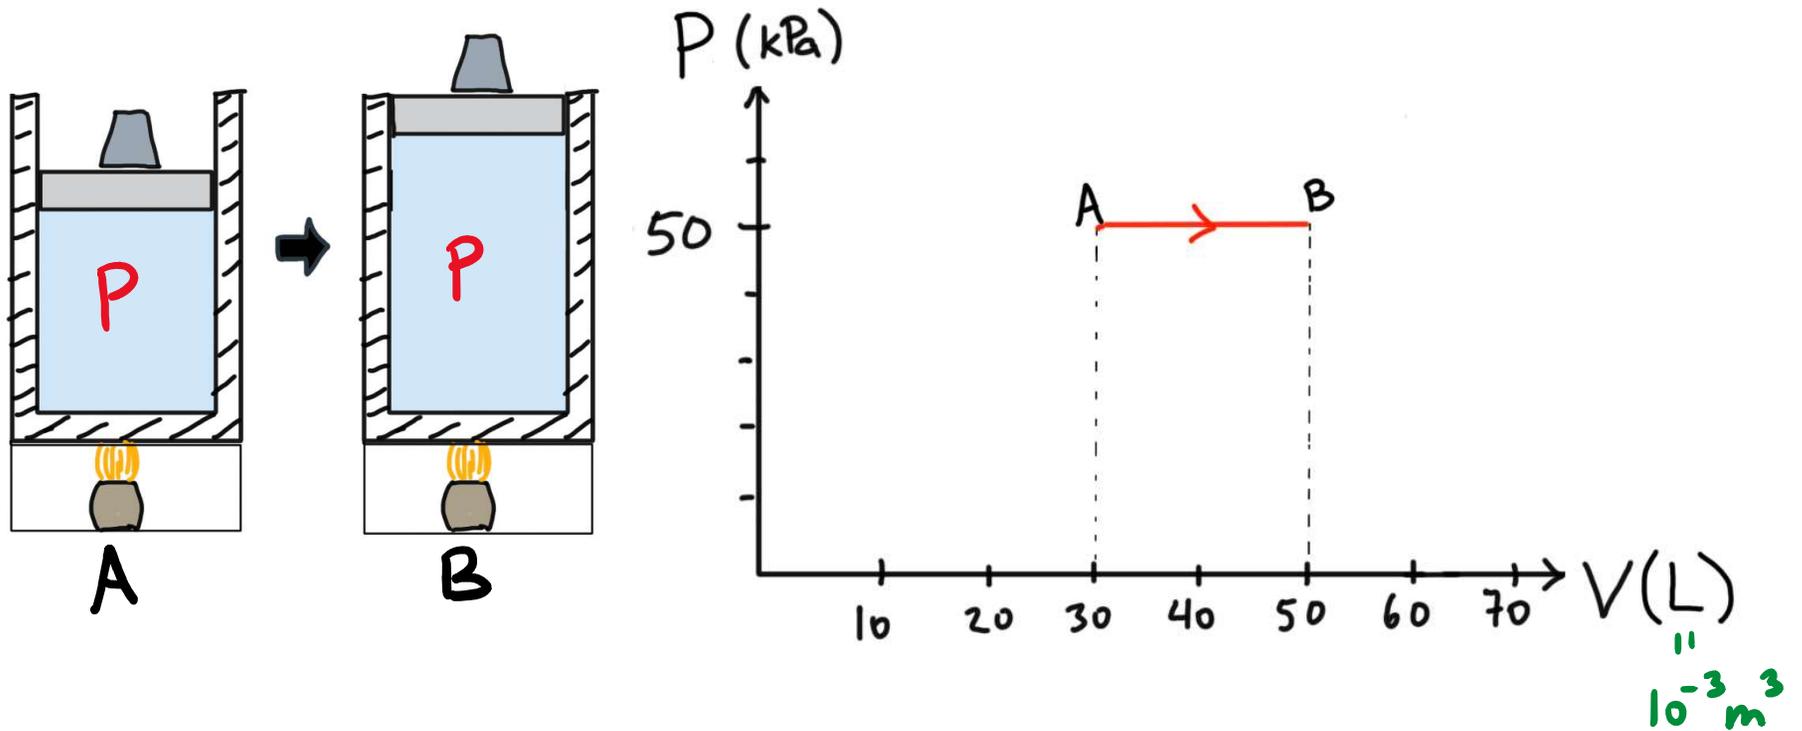

$\uparrow F/A \quad \uparrow A \Delta x$

Compression:  
 $W_{\text{gas}}$  negative

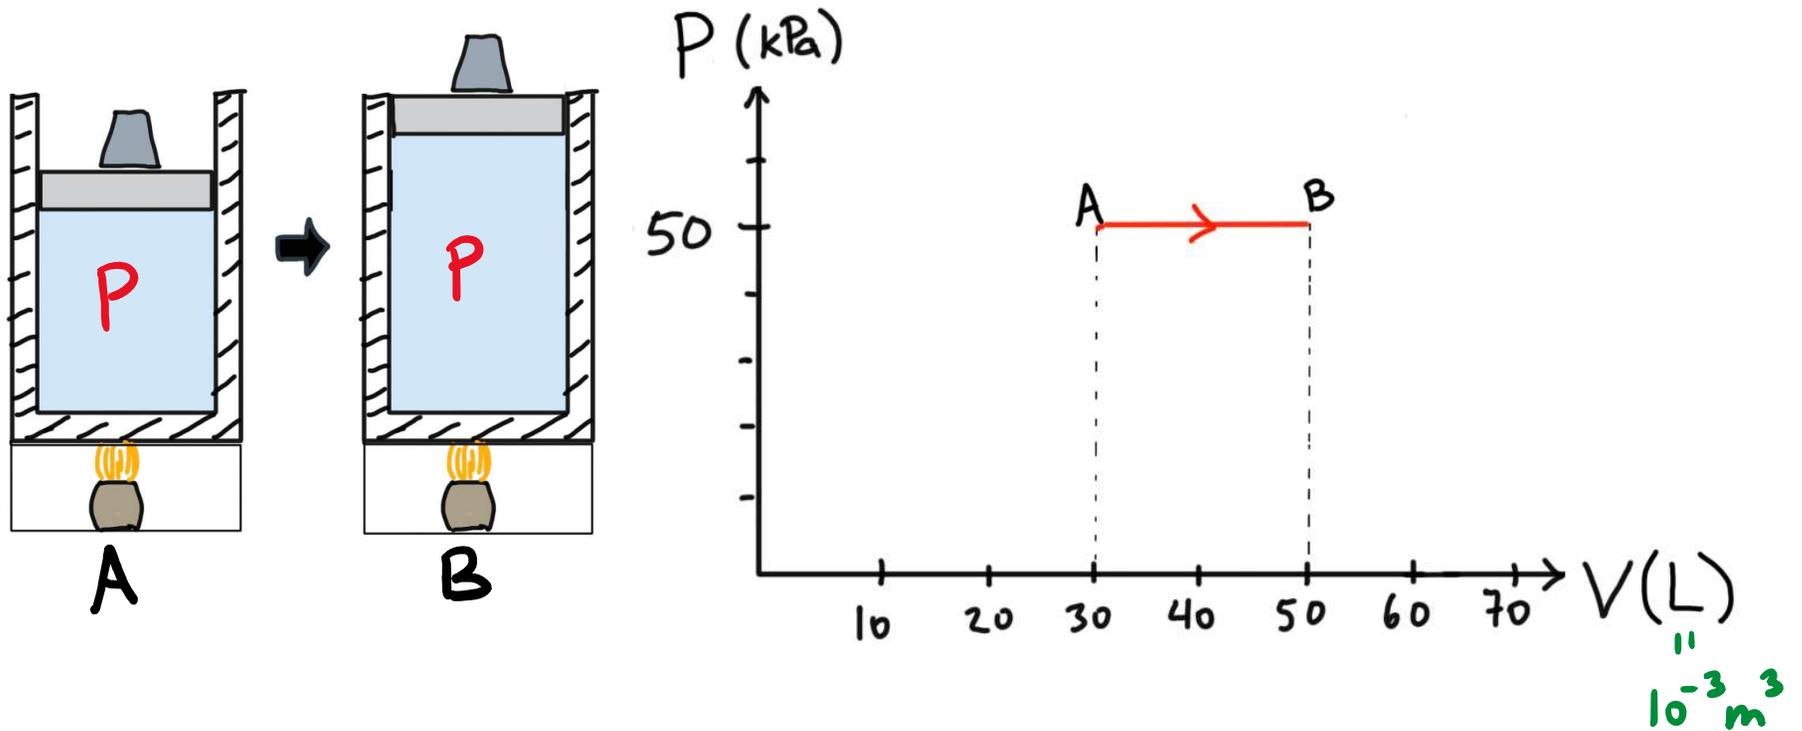

expansion:  
 $W_{\text{gas}}$  positive

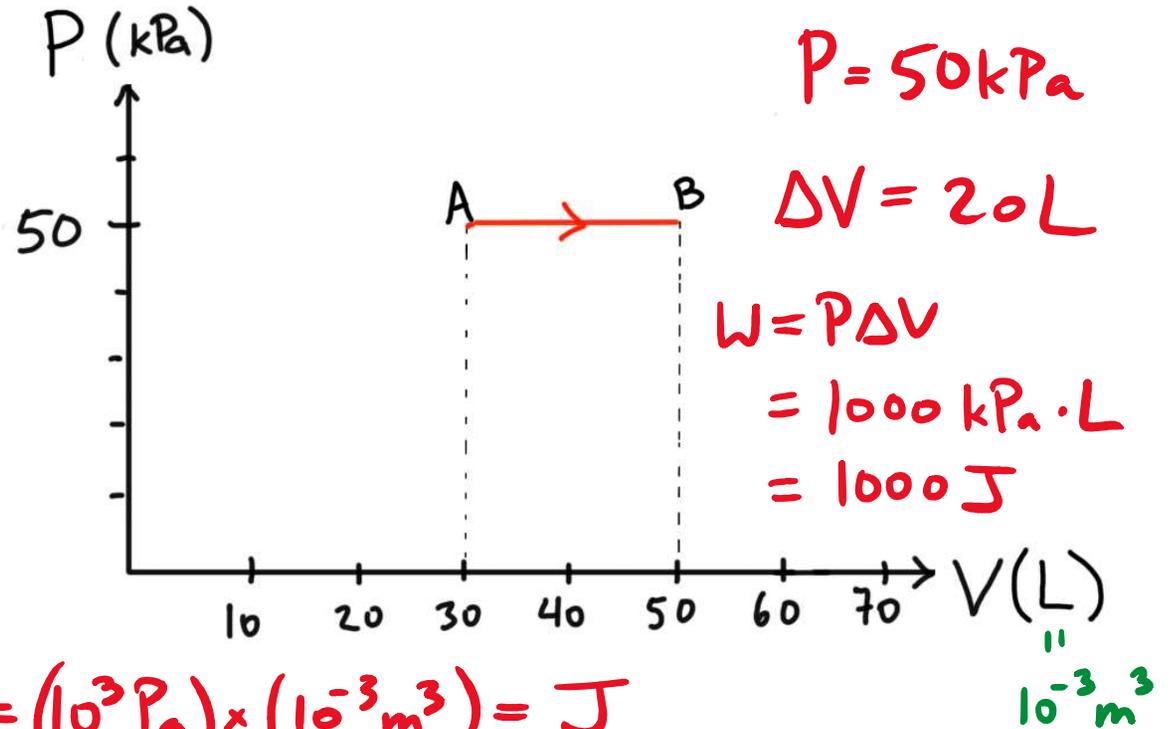

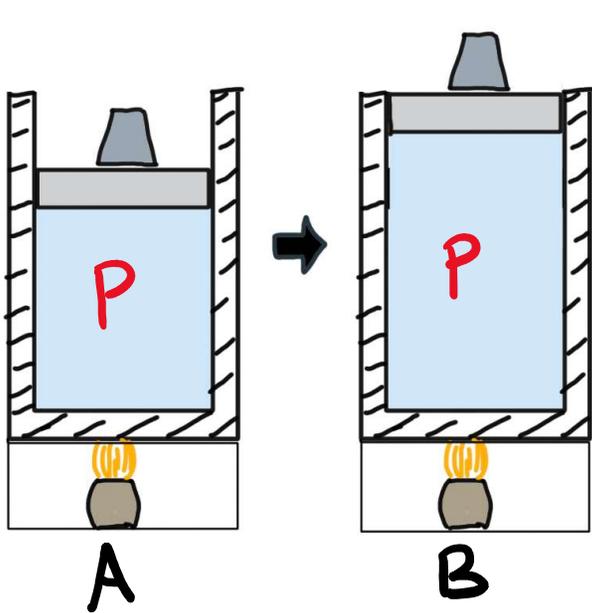

The graph shows how the pressure and volume of the gas in the cylinder change during the process A  $\rightarrow$  B. How much work does the gas do in this process?

- A) -100,000J                      B) 100J                      C) 1000J  
 D) 2500J                      E) 100,000J

The graph shows how the pressure and volume of the gas in the cylinder change during the process A  $\rightarrow$  B. How much work does the gas do in this process?

- A) -100,000J
- B) 100J
- C) 1000J
- D) 2500J
- E) 100,000J

$\bullet \text{ kPa} \times \text{L} = (10^3 \text{ Pa}) \times (10^{-3} \text{ m}^3) = \text{J}$

The graph shows how the pressure and volume of the gas in the cylinder change during the process A → B. How much work does the gas do in this process?

A) -100,000J

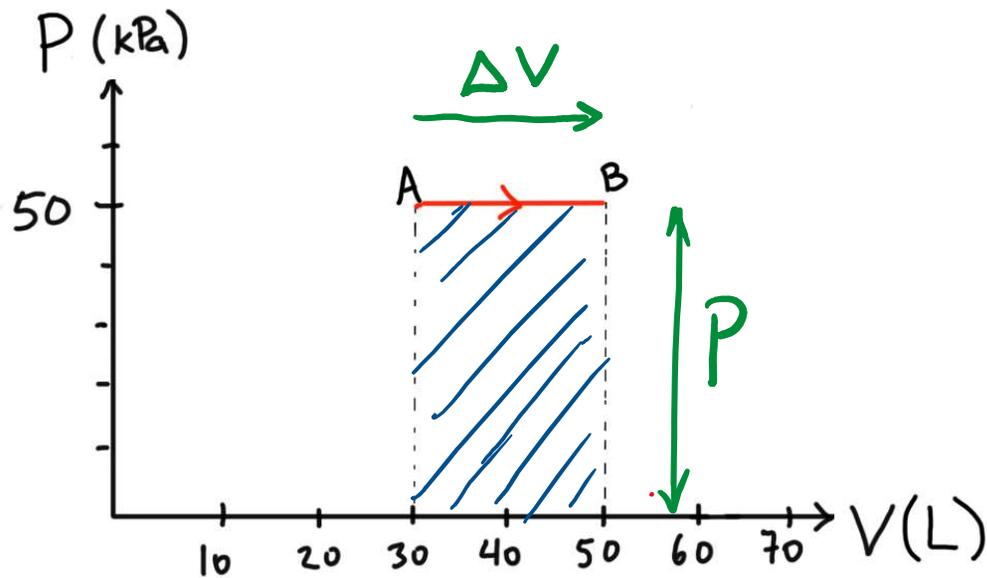

B) 100J

C) 1000J

D) 2500J

E) 100,000J

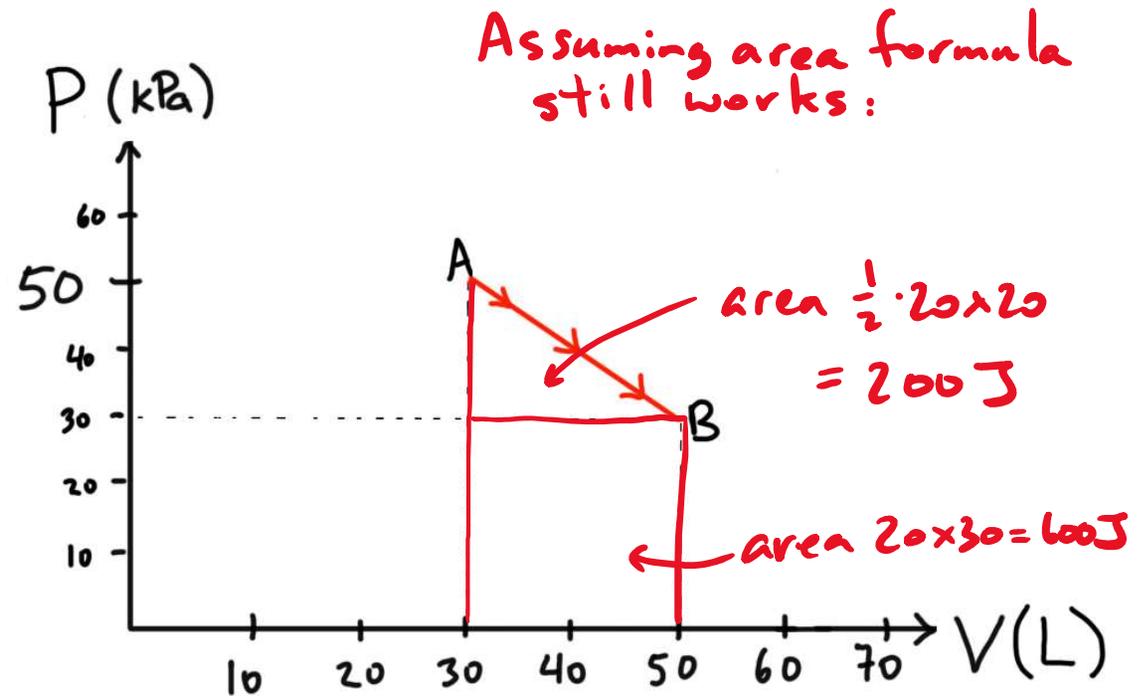

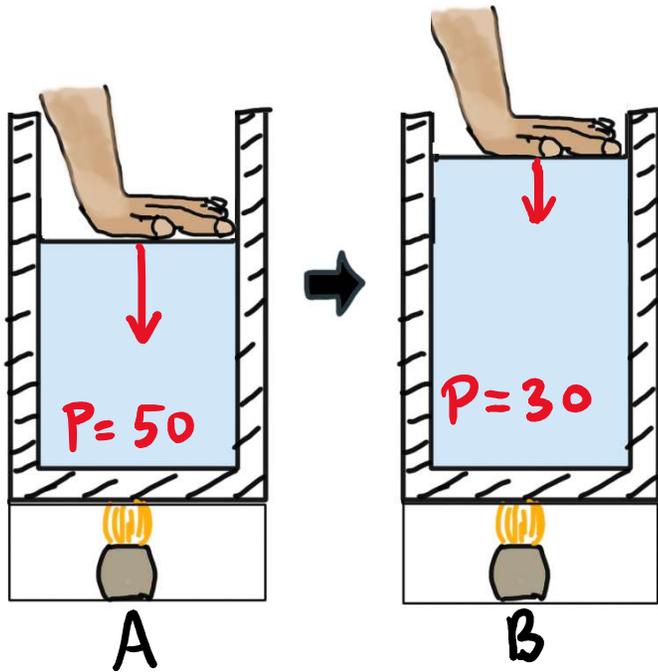

Work is the area under the P vs V graph

$$W = P \Delta V$$

- + if V increasing
- if V decreasing

$$W = 600 \text{ J} + 200 \text{ J} = 800 \text{ J}$$

The graph shows how the pressure and volume of the gas in the cylinder change during the process A  $\rightarrow$  B. How much work does the gas do in this process?

$V$  is increasing so  $W$  +ve

A) 200J

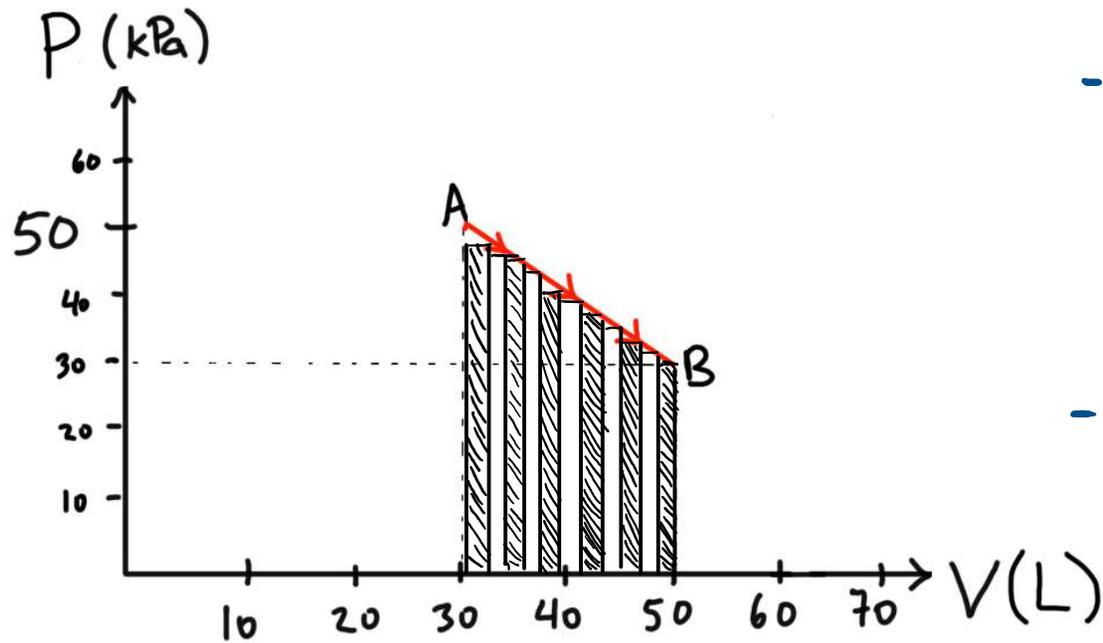

B) 600J

C) 800J

D) 1000J

E) -800J

# Work done by a gas : changing pressure

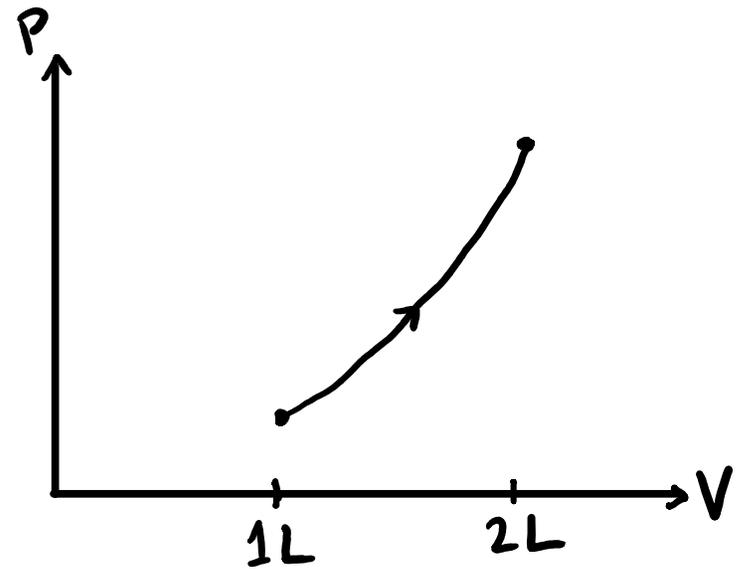

- Break process into small steps with almost constant  $P$
- Add up  $dW = P dV$  for all parts (area of skinny rectangles)

Result:  $W$  is area under the  $P$  vs  $V$  graph

$$\text{Math: } W = \int_{V_i}^{V_f} P(V) dV$$

An ideal gas is heated and allowed to expand from a volume 1L to a volume 2L in such a way that the pressure is equal to  $P = a V^2$  where  $a = 100\text{kPa/L}^2$ . How much work is done by the gas?

Need:  $W = \int_{V_i}^{V_f} P(V) dV$  ← area under the curve

The mathematical recipe:

- 1) find a function  $F(V)$  whose derivative is  $P(V)$
- 2) the integral is  $F(V_f) - F(V_i)$

An ideal gas is heated and allowed to expand from a volume 1L to a volume 2L in such a way that the pressure is equal to  $P = a V^2$  where  $a = 100\text{kPa/L}^2$ . How much work is done by the gas?

Need:  $W = \int_{V_i}^{V_f} P(V) dV$  ← area under the curve

The mathematical recipe:

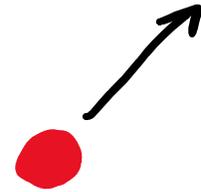

1) find a function  $F(V)$  whose derivative is  $P(V)$   $F(V) = \frac{1}{3} \cdot a \cdot V^3$

2) the integral is  $F(V_f) - F(V_i)$

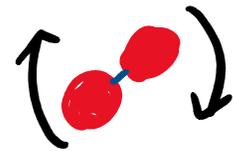

$$W = \frac{1}{3} a V_f^3 - \frac{1}{3} a V_i^3 = \frac{100}{3} \cdot (2^3 - 1^3) = 233 \text{ J}$$

$U$ : The energy of a gas

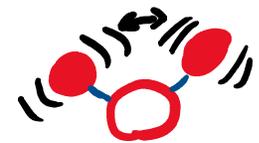

Sum of: kinetic energy

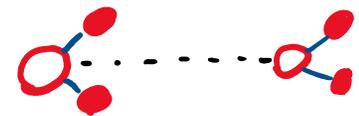

rotational energy

vibrational energy

electrostatic potential energy

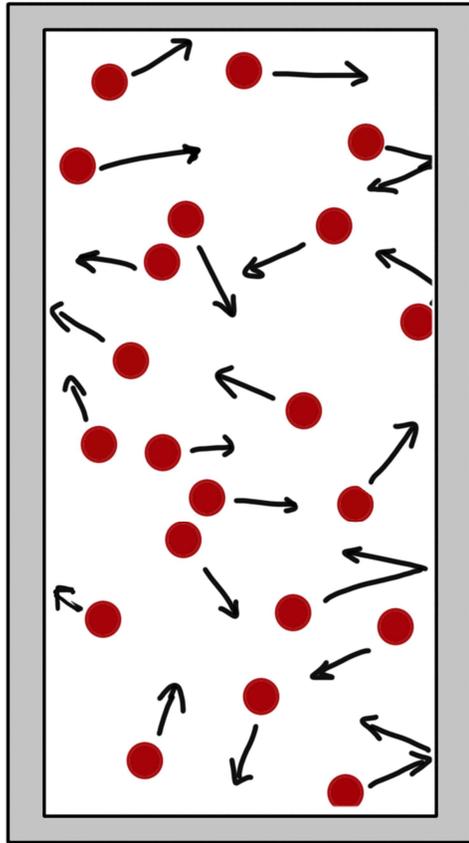

Main equation:

$$\Delta U = n C_v \Delta T$$

molar specific heat: larger for more complex molecules

# Example: Energy of a monatomic ideal gas

$U$  = total kinetic energy of molecules

$$= n \times N_A \times E_{\text{kin}}^{\text{avg}}$$

# moles  $\nearrow$  Avogadro's number  $\nearrow$

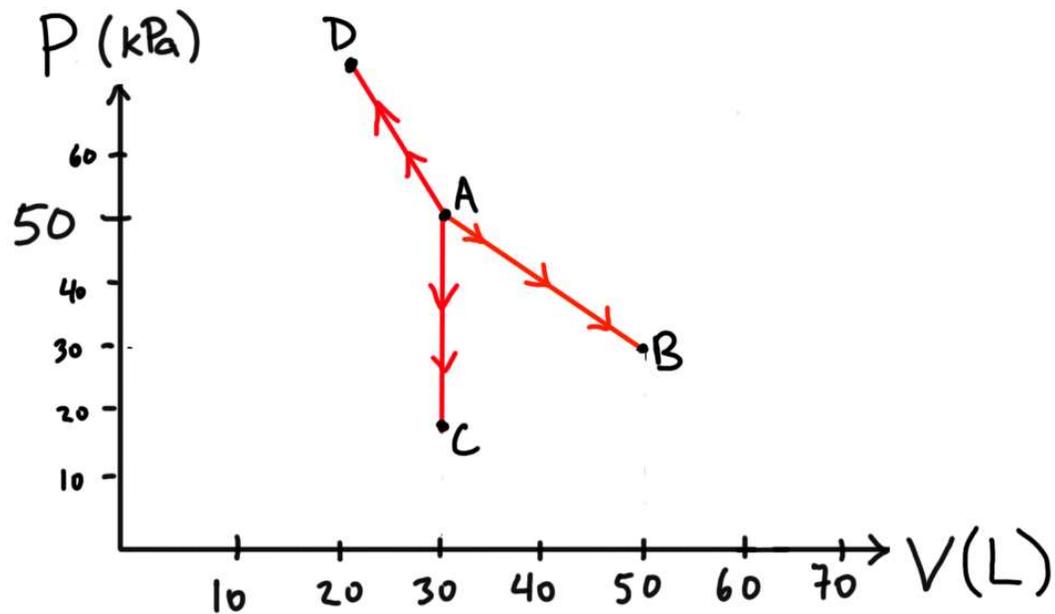

$$E_{\text{kin}}^{\text{avg}} = \left[ \frac{3}{2} \frac{R}{N_A} \right] \times T$$

proportionality constant  $\nearrow$

Plug in:  $U = \frac{3}{2} n R T$

$$\Delta U = n \left[ \frac{3}{2} R \right] \Delta T$$

$C_V$  for monatomic ideal gas  $\nearrow$

Extra

During which of the processes shown is the work done by the gas negative?

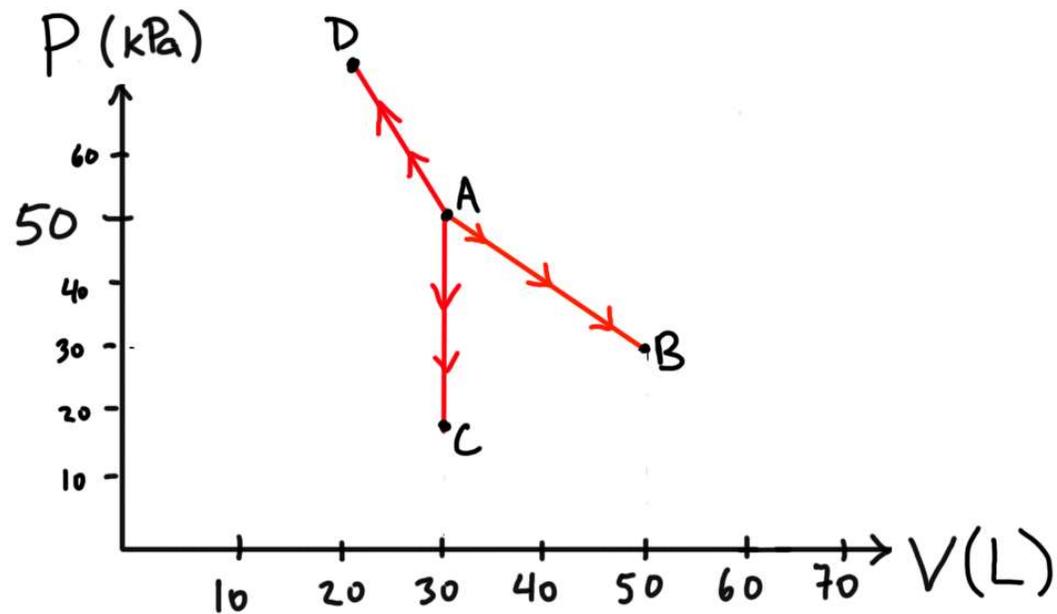

*W negative if V decreases  
so A → D*

A)  $A \rightarrow B$

B)  $A \rightarrow C$

C)  $A \rightarrow D$

D) Both  $A \rightarrow B$  and  $A \rightarrow C$

Extra:

During which of the processes shown is the work done by the gas negative?

- A)  $A \rightarrow B$
- B)  $A \rightarrow C$
- C)  $A \rightarrow D$
- D) Both  $A \rightarrow B$  and  $A \rightarrow C$
